

Installing HyperSpy Python package using miniforge

1. Installing MiniForge

If you already have MiniForge, MiniConda or Anaconda installed, you can skip ahead to 2. **Making virtual environment**

Windows

1. Download from here: <https://conda-forge.org/download/> choose Windows
2. After installing, open “Miniforge Prompt”. If you can’t find it, search for it in the start menu.

MacOS

1. Download and install homebrew: <https://brew.sh/>
2. Open the terminal and install miniforge via homebrew:
`brew install --cask miniforge`
3. In the terminal run the command:
`conda init zsh`

If you do not want to use homebrew, you can follow the guide for install miniforge directly: <https://conda-forge.org/download/>

2. Making virtual environment

1. In the Miniforge Prompt, run this command to create a virtual environment:
`conda create --name pyxem2026`
2. Activate the environment:
`conda activate pyxem2026`
3. Install the packages (this might take a long time):
`conda install pyxem hyperspy exspy ipynb jupyterlab -c conda-forge`

If this succeeds, you’re all done! If you had problems let one the organizers know on Tuesday before the program starts, or during the coffee break.
